

The task:

“It is based on a simple version of the common data set Adclaro would get for a MMM project. The task here is to help the client analyse the effectiveness of their media campaigns. The client is an FMCG business and the product is bottled water.

Tab “Variable dictionary” explains every variable used.

You need to explore the data, identify some patterns (or potential questions that arise from it) and build a simple model (using any preferred software).

You will then prepare a short presentation, 5-6 slides lasting ~15-20 minutes, to explain the findings and observations that will be discussed in the next interview session.

Key requirements / what we're looking for:

- **Data Overview**
- **Identifying the impact and effectiveness of media on product sales activity**
- **Presenting your findings in a "client-facing" style, but be able to support with technical know-how (i.e. how you got there)**
- **Identifying and commenting on other influential variables impacting product sales activity”**
